

Target-integrator

1.Learning goals

In this course, we mainly use building block to build a target frame, fix the micro:bit and Basic expansion board to the target frame, and learn how to use the input building blocks to detect whether the micro:bit is picked up by the ball.

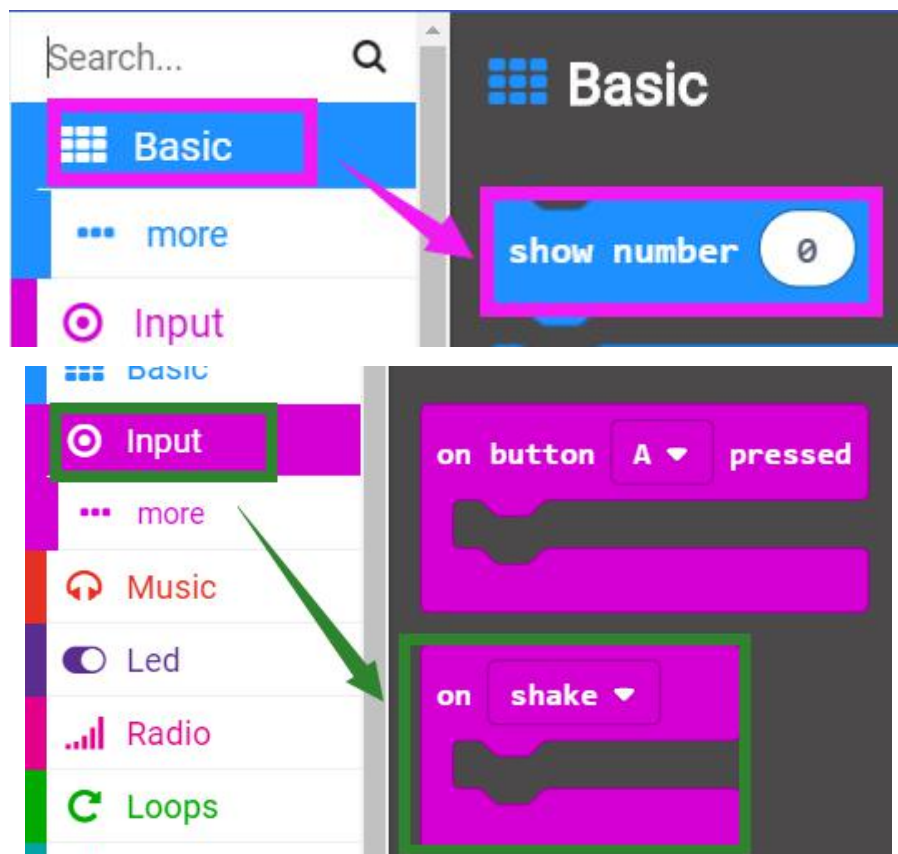

2.Programming method:

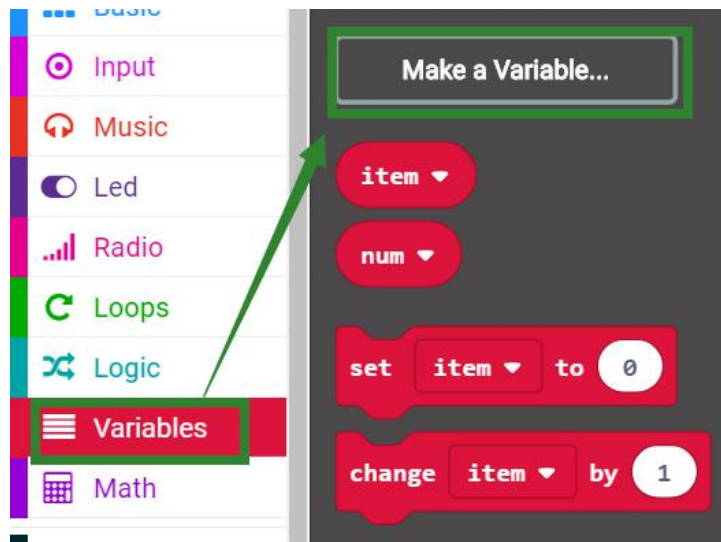

Mode 1 online programming: First, we need to connect the micro:bit to the computer by USB cable. The computer will pop up a USB flash drive and click on the URL in the USB flash drive: <http://microbit.org/> to enter the programming interface to program.

Mode 2 offline programming: We need to open the offline programming software. After the installation is complete, enter the programming interface, click **【New Project】** to program.

3.Looking for blocks

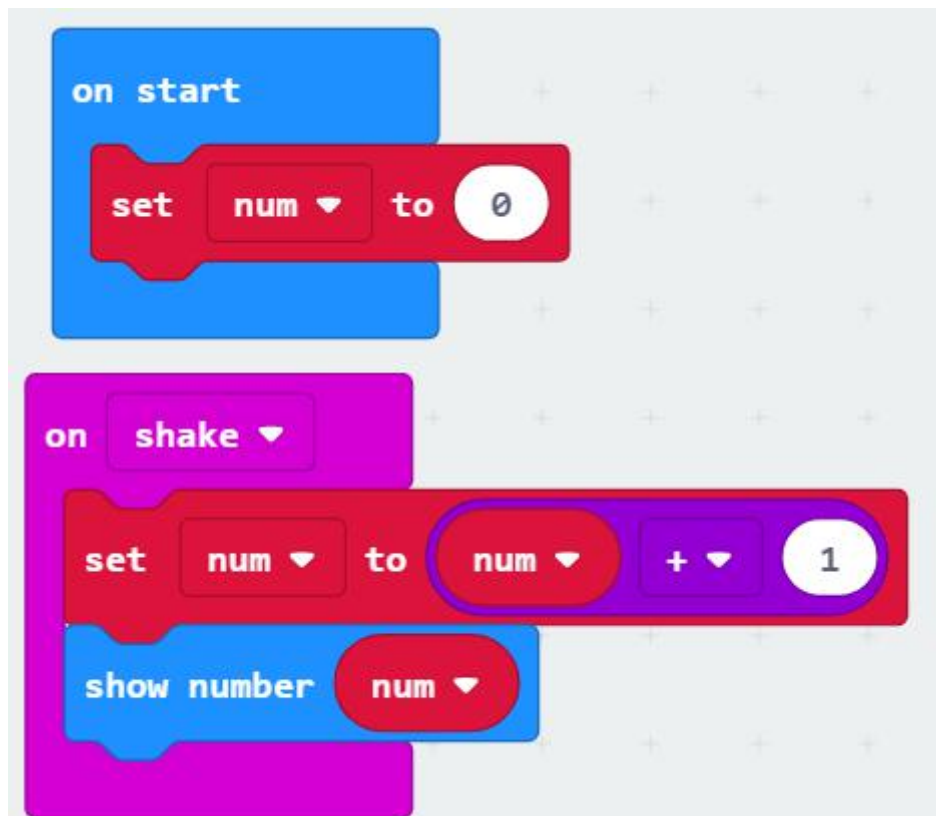

The following is the location of the building blocks required for this programming.

4. Combine building block

The summary program is shown below:

5. Experimental phenomena

After the program is successfully downloaded, there is no display on the micro:bit dot matrix.

After the micro:bit is picked up by the ball, it will cause the vibration to make the micro:bit count, and the score will be displayed on the dot matrix.

If you need to start again, press the reset button on the back of the micro:bit motherboard.
